

The following document contains information on Cypress products. Although the document is marked with the name "Spansion" and "Fujitsu", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

Continuity of Specifications

There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

Continuity of Ordering Part Numbers

Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

About Cypress

Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM™ and SRAM, Traveo™ microcontrollers, the industry's only PSoC® programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense® capacitive touch-sensing controllers, and Wireless BLE Bluetooth® Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

■ DESCRIPTION

The MB91470/480 series is Fujitsu semiconductor's general-purpose 32-bit RISC microcontroller, which is designed for embedded control applications that require high-speed processing performance.

This series uses the FR60 CPU, which is compatible with the FR* family of CPUs.

* : FR, the abbreviation of FUJITSU RISC controller, is a line of products of Fujitsu Semiconductor Limited.

■ FEATURES

- FR60 CPU
 - 32-bit RISC, load/store architecture, five-stage pipeline
 - Operating frequency of 80 MHz (PLL clock multiplied)
 - 16-bit fixed-length instructions (basic instructions)
 - Instruction execution speed : one instruction per cycle
 - Memory-to-memory transfer, bit processing, barrel shift instructions, etc. : instructions suitable for embedded applications
 - Function entry and exit instructions, multi load/store instructions of register contents: instructions compatible with C language.
 - Register interlock function to facilitate assembly-language coding
 - Built-in multiplier/instruction-level support
 - Signed 32-bit multiplication : 5 cycles
 - Signed 16-bit multiplication : 3 cycles
 - Interrupts (save PC and PS) : 6 cycles, 16 priority levels
 - Harvard architecture allowing program access and data access to be executed simultaneously
 - Instructions compatible with the FR family

- I/O ports
- NMI (Non Maskable Interrupt)
- External interrupts
- Bit search module (for REALOS*)
Function to search for the position of the first bit that has changed from 1 to 0 in a word starting from the MSB
- 16-bit reload timers
- Timing generator
- 8/16-bit PPG timers
- Multi-function timer
 - 16-bit free-run timer
 - Input capture (Linked to free-run timer)
 - Output compare (Linked to free-run timer)
 - A/D start up compare (Linked to free-run timer)
 - Wave form generator
Various wave forms are generated by using output compare output, 16-bit PPG timer and 16-bit dead timer.
- Base timer
Only one timer function can be selected from the 16-bit PWM timer, 16-bit PPG timer, 16/32-bit reload timer, and 16/32-bit PWC timer.
- 8/16-bit up/down counter
- Multi-function serial interface
 - Full-duplex double buffer
 - With 16-byte FIFO
 - Asynchronous (start-stop synchronization) communication, clock synchronous communication, I²C standard mode (Max 100 kbps), I²C high-speed mode (selectable various modes at maximum of 400 kbps)
 - Selectable parity On/Off
 - Each channel has built-in baud rate generator
 - Error detection function for parity, frame and overrun errors
 - External clock can be used as transfer clock
 - With I²C function
- 8/10-bit A/D Converter (Successive comparison type)
 - Resolution : 8-bit or 10-bit resolution selectable
 - Conversion time : 1.2 μs (minimum conversion time for 33 MHz peripheral clock (CLKP))
1.2 μs (minimum conversion time for 40 MHz peripheral clock (CLKP))

(Continued)

(Continued)

- 12-bit A/D Converter (successive approximation type)
 - Resolution : 12 bits
 - Conversion Time : 2.0 μ s (minimum conversion time for 33 MHz peripheral clock (CLKP))
2.2 μ s (minimum conversion time for 40 MHz peripheral clock (CLKP))
 - Differential input mode is available.
- Clock monitor
 - Peripheral clock (CLKP) divided by 2/4/8/16/32/64/128/256 can be output.
- Multiplication and Addition Calculator
 - RAM : Instruction RAM (I-RAM) 256 \times 16-bit
Factor RAM (X-RAM) 64 \times 32-bit
Variable RAM (Y-RAM) 64 \times 32-bit
 - High-speed multiplication and addition (seven-stage pipeline processing)
 - Product addition (32-bit \times 32-bit + 72-bit)
 - Operation result is extracted rounded from 72 bits to 32 bits or 72-bit result data reading.
- DMAC (DMA Controller)
 - Transfers can be started by software or by interrupts from the built-in peripherals.
- Wild register
 - Instructions or data located at a target address can be replaced (in the built-in Flash/ROM area only) .

- External bus interface
 - Maximum operating frequency of 40 MHz
 - 16-bit address full output (64 Kbytes space) capability
 - 8/16-bit data output
 - Use of unused data/address pins as general-purpose I/O ports
 - Totally independent 3-area chip select outputs that can be set at minimum of 64 Kbytes.
 - Support of interface for various memory (SRAM, ROM/Flash)
 - Basic bus cycle : 2 cycles
 - Automatic wait cycle generator that can be programmed for each area and can insert waits
 - External wait cycle using RDY input

- Other Features
 - Watchdog timer
 - Low-power consumption modes
 - Sleep/stop function
 - CMOS technologies : 0.18 μ m
 - Power supply : Single power supply ($V_{CC} = 4.0$ V to 5.5 V)

■ HANDLING DEVICES

- Preventing latch-up

Latch-up phenomenon may occur with CMOS IC, when a voltage higher than V_{CC} or lower than V_{SS} is applied to either the input or output terminals, or when a voltage is applied between V_{CC} pin and V_{SS} pin that exceeds the rated voltage. When latch-up occurs, a significant power-supply current surge results, which may damage some elements due to the excess heat, so great care must be taken to ensure that the maximum rating is never exceeded during use.

- Treatment of unused input pins

Do not leave an unused input pin open, since it may cause a malfunction. Handle by, for example, using a pull-up or pull-down resistor.

- Power pins

In products with multiple V_{CC} and V_{SS} pins, the pins of the same potential are internally connected in the device to avoid abnormal operations including latch-up. However, you must connect the pins to the same potential power supply and a ground line externally to lower the electro-magnetic emission level, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with the V_{CC} and V_{SS} pins of this device at the low impedance. It is also advisable to connect a ceramic capacitor of approximately $0.1 \mu\text{F}$ as a bypass capacitor between V_{CC} and V_{SS} near this device.

- Crystal oscillator circuit

Noise near the X0 and X1 pins may cause the device to malfunction. Design the printed circuit board so that X0, X1, the crystal oscillator (or ceramic oscillator), and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended to design the PC board artwork with the X0 and X1 pins surrounded by ground plane because stable operation can be expected with such a layout. Please ask the crystal maker to evaluate the oscillational characteristics of the crystal and this device.

- About mode pins (MD0 to MD2)

These pins should be connected directly to V_{CC} pin or V_{SS} pin.

Design the printed circuit board such that the pull-up/down resistance stays low, as well as the distance between the mode pins and power supply or GND pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

- Operation at start-up

Be sure to execute setting initialized reset (INIT) with INITX pin immediately after start-up.

Immediately after that, also, hold the "L"-level input to the INITX pin for the stabilization wait time required for the oscillator circuit to take the oscillation stabilization wait time for the oscillator circuit and the stabilization wait time for the regulator (For INIT via the INITX pin, the oscillation stabilization wait time setting is initialized to the minimum value).

- Notes upon power-on sequence

It requires more than 600 μs (between 0.0 V to 5.0 V) to rise voltage upon power on in order to prevent the device malfunction caused by the overshooting in the built-in voltage step-down circuit.

After the supply voltage is stable (voltage is risen) , it takes 600 μs until internal supply is stable. Hold the input to the INITX pin during that period.

If it takes less than 600 μs (between 0.0 V to 5.0 V) for power up, it requires 2 ms* until internal supply is stable after voltage supply is stable (voltage is risen) . Hold the input to the INITX pin during that period.

* : In case of which it takes less than 600 μs (between 0.0 V to 5.0 V) to rise voltage, the time to make internal power supply stable is proportional to the capacitance value of the bypass capacitor for the pin C. It takes 2 ms if the pin C = 4.7 μF ; 4 ms if the pin C = 9.4 μF .

MB91470/480 Series

- Order of power turning ON/OFF

Use the following procedure for turning the power on or off. If not using the A/D converter, connect $AV_{CC} = V_{CC}$ and $AV_{SS} = V_{SS}$. Turn on the power supply in the sequence $V_{CC} \rightarrow AV_{CC} \rightarrow AVR_{H}$, and turn off the power in the reverse sequence.

- Source oscillation input when turning on the power

When turning the power on, maintain the clock input until the device is released from the oscillation stabilization wait state.

- Cautions for operation during PLL clock mode

Even if the oscillator comes off or the clock input stops with the PLL clock selected for MB91470/480 series, MB91470/480 series may continue to operate at the free-run frequency of the PLL's internal self-oscillating oscillator circuit.

Performance of this operation, however, cannot be guaranteed.

- Using an external clock

When using an external clock, you must always input clock signals with opposite phase from X0 pin to X1 pin simultaneously. However, as the X1 pin halts with an output at the "H" level during stop mode, insert a resistor of approximately 1 k Ω externally to prevent a conflict between the two outputs if using stop mode (oscillation stop mode).

The figure below shows an example of how to use an external clock.

- Example of Using an External Clock

- C pin

As MB91470/480 series includes an internal regulator, always connect a bypass capacitor of approximately 4.7 μF to the C pin for use by the regulator.

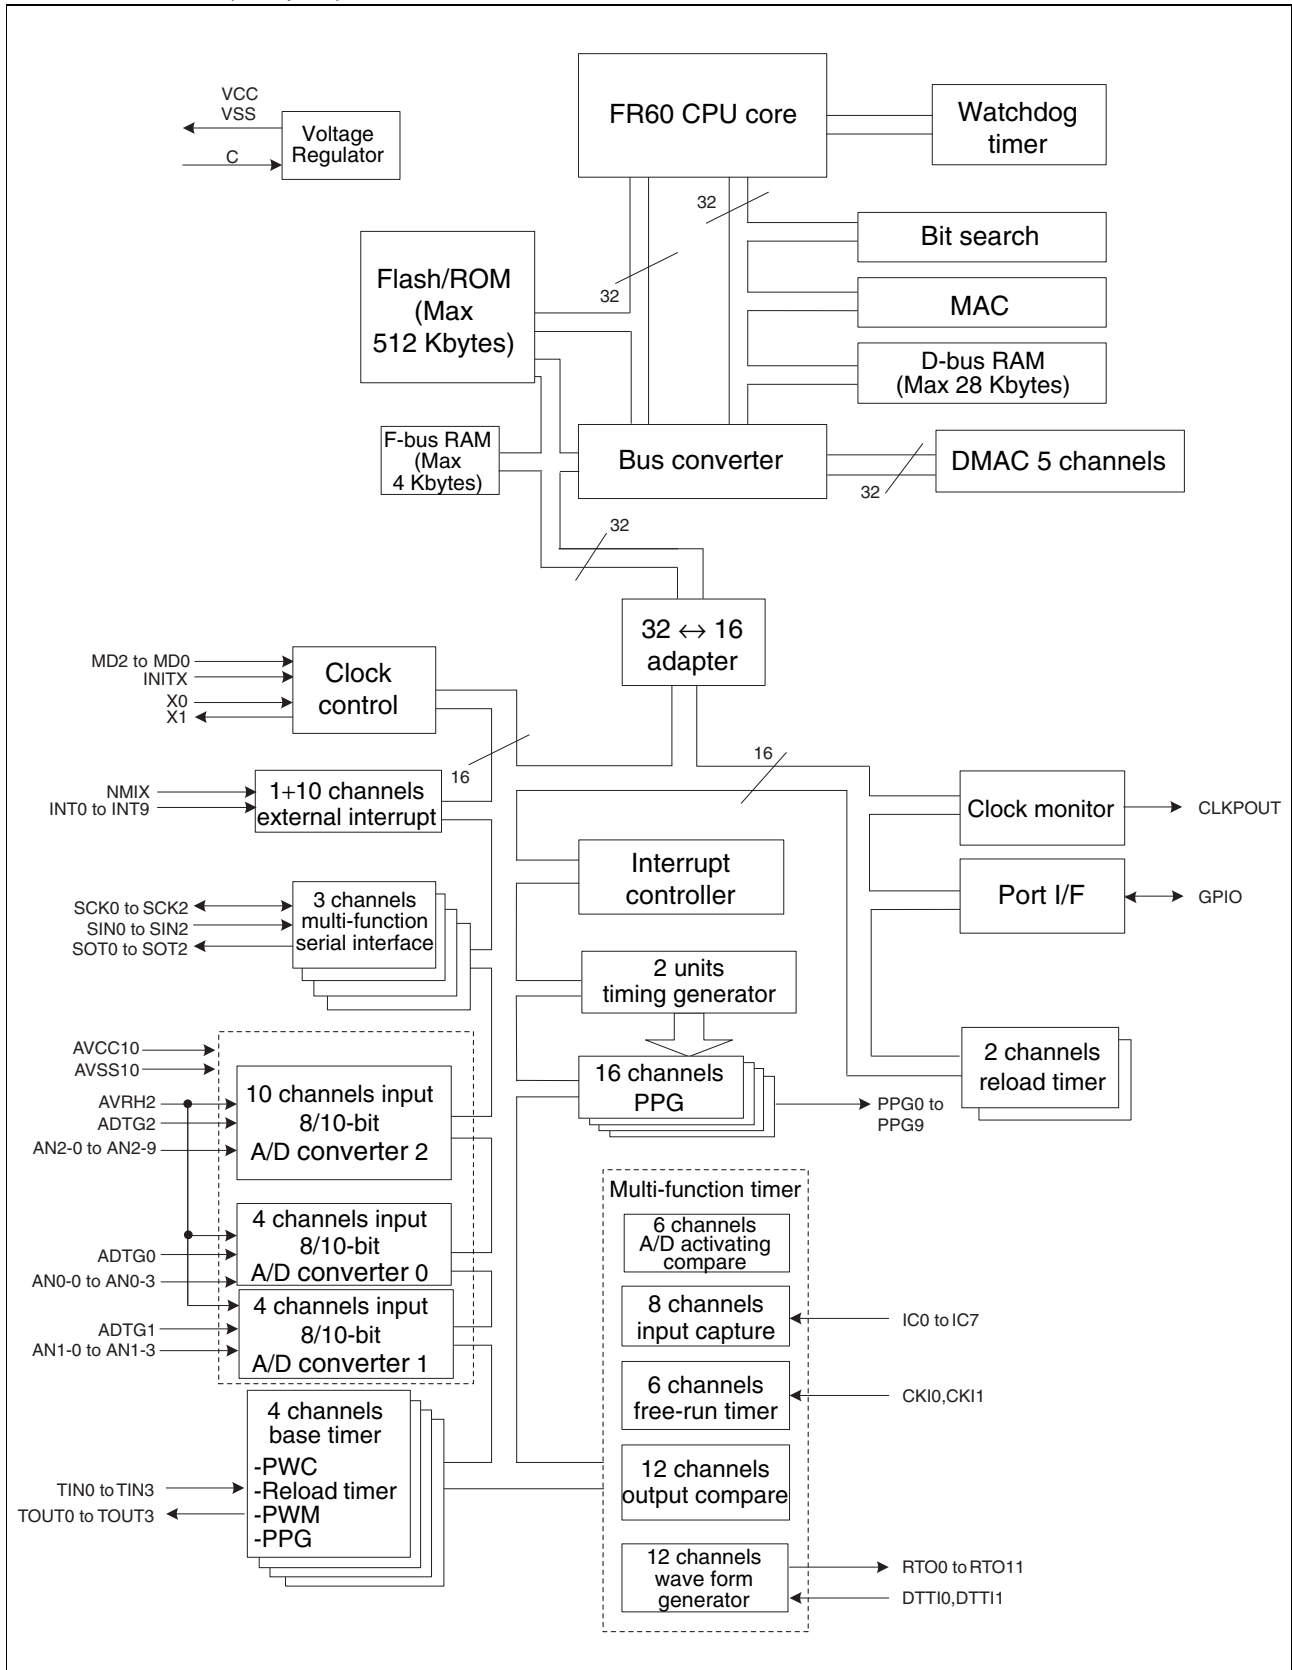

- Software reset on the synchronous mode

Be sure to meet the following two conditions before setting 0 to the SRST bit of STCR (standby control register) when the software reset is used on the synchronous mode.

- Set the interrupt enable flag (I-Flag) to interrupts disabled (I-Flag=0).
- Not used NMI

■ MEMORY SPACE

1. Memory Space

The FR family has 4 Gbytes of logical address space (2^{32} addresses) available to the CPU by linear access.

• Direct Addressing Areas

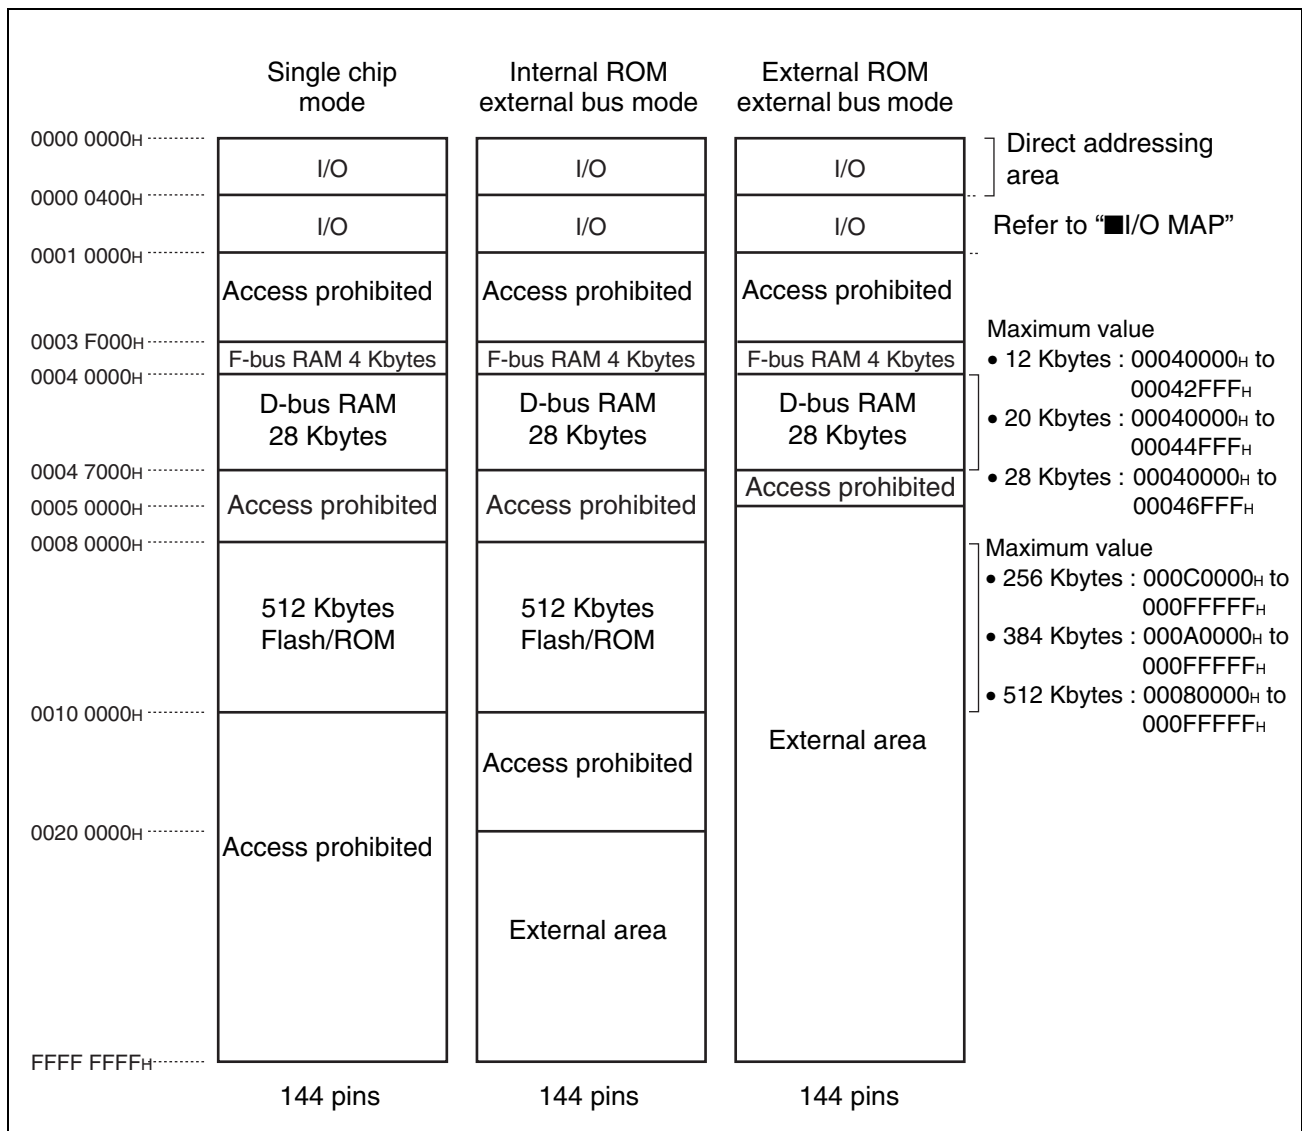

The following address space areas are used as I/O areas.

These areas are called direct addressing areas, in which the address of an operand can be specified directly by the instruction. The size of directly addressable areas depends on the length of the data being accessed as shown below.

- byte data access : 000_H to 0FF_H
- half word data access : 000_H to 1FF_H
- word data access : 000_H to 3FF_H

■ MODE SETTINGS

The FR family uses mode pins (MD2 to MD0) and mode data to set the operation mode.

1. Mode Pins

The MD2 to MD0 pins specify how the mode vector fetch and reset vector fetch is performed. Settings other than those shown in the following table are prohibited.

Mode Pins			Mode name	Reset vector access area	Remarks
MD2	MD1	MD0			
0	0	0	Internal ROM mode vector	Internal	
0	0	1	External ROM mode vector	External	The bus width is set by mode register.

2. Mode data

The data that is written to the internal mode register (MODR) by the mode vector fetch is called mode data. After the mode register is set, the device runs in the operating mode specified by this register. The mode data is set by all of the reset sources. User programs cannot set the mode register.

<Details of mode data description>

[bit 23 to bit 19] Reserved bits

Be sure to set these bits to "00000_B".

Operation is not guaranteed if these bits are set to a value other than "00000_B".

[bit 18] ROMA (Internal Flash/ROM enable bit)

This bit configures whether the internal Flash/ROM area (8 0000_H to F FFFF_H) is enabled.

ROMA	Function	Remarks
0	External ROM mode	Internal Flash/ROM area (8 0000 _H to F FFFF _H) is used as an external area.
1	Internal ROM mode	Internal Flash/ROM area (8 0000 _H to F FFFF _H) is enabled.

MB91470/480 Series

[bit 17, bit 16] WTH1, WTH0 (Bus width specification bit)

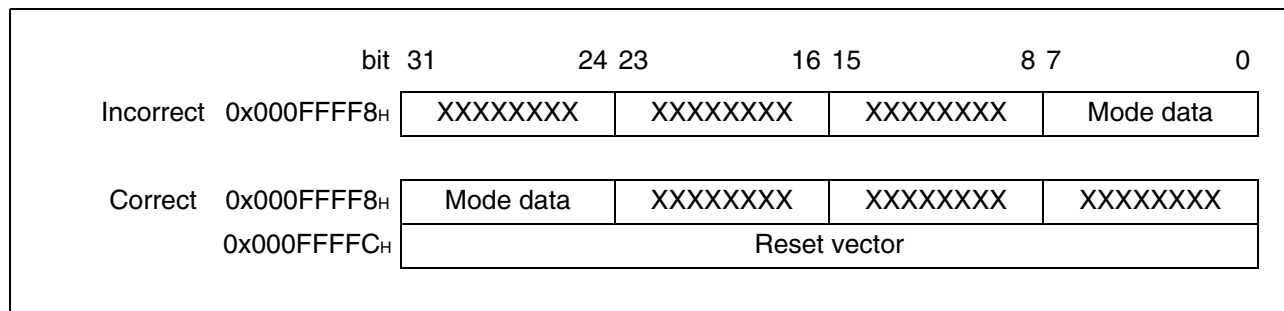

These bits configure the bus width in external bus mode.

In external bus mode, this value is set to the DBW1 and DBW0 bits of AWR0 (CS0 area).

WTH1	WTH0	Function	Remarks
0	0	8-bit bus width	External bus mode
0	1	16-bit bus width	External bus mode
1	0	—	(Setting prohibited)
1	1	Single chip mode	Single chip mode

3. Note

The mode data set in the mode vector must be stored as byte data at 0x000FFFF8_H. The data should be located in the highest byte from bit 31 to bit 24 because the FR family uses big endian byte ordering.

000000 _H	PDR0 [R/W] B ↑XXXXXXXX↑	PDR1 [R/W] B XXXXXXXX	PDR2 [R/W] B XXXXXXXX	PDR3 [R/W] B XXXXXXXX	T-unit Port data register

Read/write attribute, Access unit
(B : byte, H : half word, W : word)

Initial value of register after reset

Register name (column 1 of the register is at address 4n, column 2 is at address 4 n + 1...)

Leftmost register address (For word-length access, column 1 of the register is the MSB of the data.)

Note : Initial values of register bits are represented as follows :

“ 1 ” : Initial Value “ 1 ”

“ 0 ” : Initial Value “ 0 ”

“ X ” : Initial Value “ undefined ”

“ - ” : No physical register at this location

Access to addresses where the data access properties have not been documented is prohibited.

*1 : The lower 16 bits (DTC15 to DTC0) of DMACA0 to DMACA4 cannot be accessed as bytes.

*2 : Register whose initial value depends on the reset level. The initial values shown are for INITX = "L".

Notes : • Data is undefined in reserved or (—) area.

- Do not execute read modify write (RMW) instruction on registers having a write-only bit.
- The initial values are varied depending on the product series. Please refer to the hardware manual of MB91470/480 for more details.

■ PIN STATUS IN EACH CPU STATE

Terms used as the status of pins mean as follows.

- Input enabled
Means that the input function can be used.
- Input disabled
Indicates that the input function cannot be used.
- Input fixed to "0"
A state of a pin, in which "0" is transmitted to internal circuitry, with the external input shut off by the input gate adjacent to the pin.
- Output Hi-Z
Means to place a pin in a high impedance state by disabling the pin driving transistor from driving.
- Preserving the previous state
Means to output the state existing immediately prior to entering this mode.
That is, to output according to an internal resource with an output when it is operating or to preserve an output when the output is provided, for example, as a port.
- Input enabled when external interrupt function selected and enabled
Inputs are allowed only when the pin is configured as an external interrupt request input pin and the external interrupt request is enabled.

*1 : These parameters are based on the condition that V_{SS} = AV_{SS}10 = AV_{SS}12 = 0 V.

*2 : Be careful not to exceed V_{CC} + 0.3 V, for example, when the power is turned on.
Be careful to set AV_{CC}10, AV_{CC}12 equal V_{CC}, for example, when the power is turned on.

*3 : The maximum output current is the peak value for a single pin.

*4 : The average output is the average current for a single pin over a period of 100 ms.

*5 : The total average output current is the average current for all pins over a period of 100 ms.

*6 : AV_{CC}10 is the analog supply voltage for the 8/10-bit A/D converter, and AV_{CC}12 is the analog supply voltage for the 12-bit A/D converter.

*7 : AVRH_n=AVRH0/AVRH1/AVRH2 are the analog reference voltage for the 8/10-bit A/D converter, and AVRH3/AVRH4 are the analog reference voltage for the 12-bit A/D converter.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

• External impedance and sampling time of analog inputs

- The A/D converter is fitted with a sample and hold circuit. If the external impedance is so high that there is not sufficient time for sampling, the internal sample and hold capacitor will not fully charge to the analog voltage, and the precision of the A/D conversion will be adversely affected. Therefore, in order to satisfy the A/D conversion precision specifications, either adjust the register values and operating frequency or reduce the external impedance so that the sampling time is greater than the minimum value as given by the relationship between external impedance and minimum sampling time. If you are still unable to hold enough sampling time, connect a capacitor of about 0.1 μF to the analog input pin.

• Analog input circuit schematic

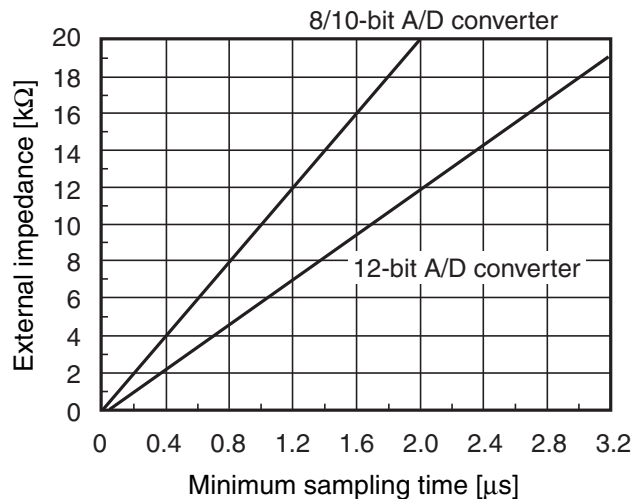

Note : The values are reference values.

• The relationship between the external impedance and minimum sampling time

(External impedance = 0 k Ω to 100 k Ω)

(External impedance = 0 k Ω to 20 k Ω)

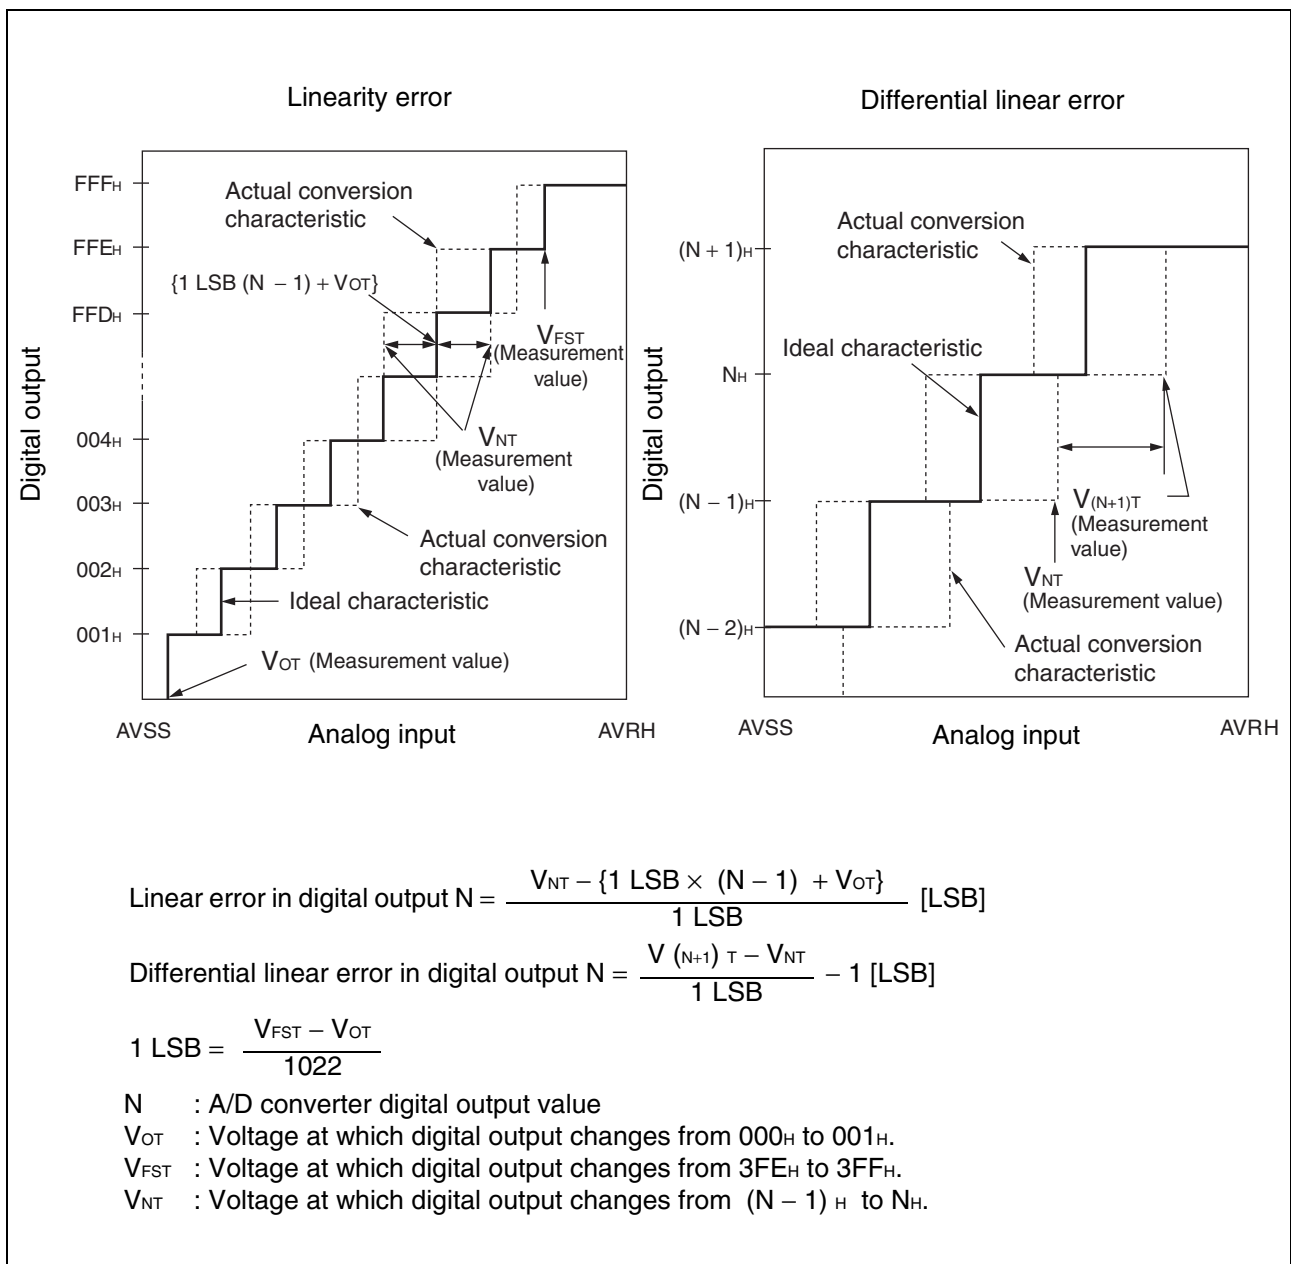

• About errors

- The relative error increases as the value of $|AVRH - AVSS|$ decreases.

MB91470/480 Series

• Definition of 8/10-bit A/D Converter Terms

- Resolution : Analog variation that is recognized by the A/D converter.
- Linearity error : Deviation between the line connecting zero transition point (000000000←→000000001) and full-scale transition point (111111110←→111111111) and actual conversion characteristics.
- Differential linear error : Deviation from the ideal value of input voltage necessary to change the output code by 1LSB.
- Total Error : This error is the difference between actual and ideal values, including the zero transition error/full-scale transition error/linearity error.

$$1 \text{ LSB}' (\text{ideal value}) = \frac{\text{AVRH} - \text{AVSS}}{1024} [\text{V}]$$

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB}' \times (N - 1) + 0.5 \text{ LSB}'\}}{1 \text{ LSB}'}$$

N : A/D converter digital output value

V_{NT} : Voltage at which digital output changes from $(N + 1)_H$ to N_H .

V_{OT}' (ideal value) = $\text{AVSS} + 0.5 \text{ LSB}'$ [V]

V_{FST}' (ideal value) = $\text{AVRH} - 1.5 \text{ LSB}'$ [V]

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of FUJITSU SEMICONDUCTOR device; FUJITSU SEMICONDUCTOR does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information.

FUJITSU SEMICONDUCTOR assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of FUJITSU SEMICONDUCTOR or any third party or does FUJITSU SEMICONDUCTOR warrant non-infringement of any third-party's intellectual property right or other right by using such information. FUJITSU SEMICONDUCTOR assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that FUJITSU SEMICONDUCTOR will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Exportation/release of any products described in this document may require necessary procedures in accordance with the regulations of the Foreign Exchange and Foreign Trade Control Law of Japan and/or US export control laws.
